

QUANTUM DRIVE

WHY QUANTUMDRIVE SYSTEMS?

PRESENTATION

INTRODUCING QUANTUM DRIVE

We have developed ceiling-mounted, wall-mounted, industrial, and portable (mobile) systems tailored to the size and type of space being secured. These systems use a dense smoke screen and an unpleasant odour to drive intruders out of the area.

OUR SYSTEMS CAN OPERATE INDEPENDENTLY OR BE INTEGRATED WITH EXISTING SECURITY SYSTEMS (SUCH AS CAMERAS AND SENSORS), PROVIDING A VALUABLE ENHANCEMENT TO YOUR CURRENT SETUP.

FOR FACILITIES WITH EXISTING PHYSICAL SECURITY, PERSONNEL WILL BE EQUIPPED WITH A REMOTE CONTROL INSTEAD OF FIREARMS. WITH A SINGLE CLICK, THEY CAN ACTIVATE OUR SYSTEM TO DRIVE AWAY UNWANTED GUESTS AND PROTECT BOTH THEIR LIVES AND PROPERTY.

The Way Our Systems Function

Our systems automatically detect unauthorized access, trigger activation, and release a dense, highly effective white smoke. This rapid response disorients intruders, forcing them to leave the premises immediately due to confusion and uncertainty about their surroundings.

The entire operation takes less than 12 seconds, resulting in zero visibility in the space and the presence of an unpleasant odour. In short, a powerful and effective smoke screen is created that drives out unwanted guests and prevents them from removing anything from the premises.

CPM CHARACTERISTICS

They are inconspicuous

- They do not require electricity
- Quick and inexpensive replacement cartridges
- Installed into any alarm system in the world or the unit can be installed without alarm integration (stand alone system)
- Unit can be set off via remote panics and or mobile application

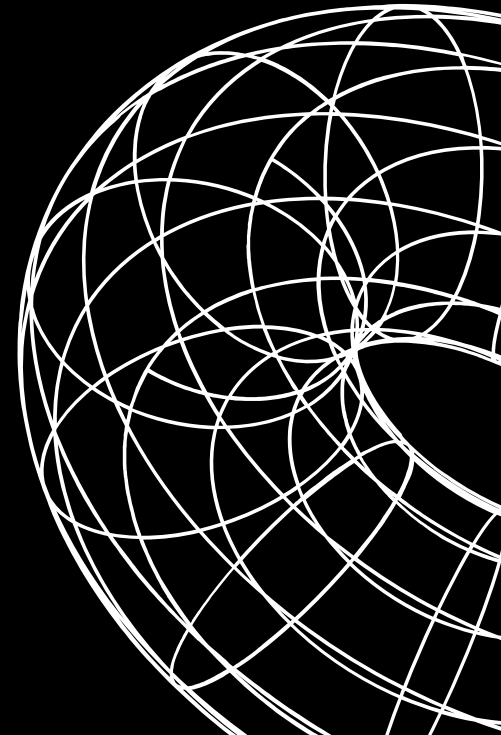

FALSE ALARM & ACCIDENTAL ACTIVATION

Some of the most common questions we receive are whether it is possible for clients to accidentally activate the system or if intruders could trigger a false alarm to activate the system without actually breaking in?

ENGINEERS AT ENFORCER SYSTEMS HAVE INVESTED THOUSANDS OF HOURS IN RESEARCH, DEVELOPMENT AND TESTING TO CREATE A SOPHISTICATED PCB ARCHITECTURE (THE INTELLIGENCE OF THE MOTHERBOARD) AND KEY PROTOCOL ALGORITHMS (WHICH LEAD TO SYSTEM ACTIVATION). THEIR WORK HAS FOCUSED ON ELIMINATING THE POSSIBILITY OF ACCIDENTAL OR INCORRECT ACTIVATIONS.

The system is activated exclusively in the event of an actual break-in, armed robbery, or if an authorised individual decides to activate it for security reasons.

THOUSANDS OF INSTALLED SYSTEMS WORLDWIDE

Some of the locations protected by our systems include: petrol stations, jewellers, high-end watch stores, currency exchange offices, technology warehouses, unique furniture stores, liquor stores, tobacco shops, private homes, holiday homes, garages, wine cellars, and public facilities that seek preventive measures against criminal activities, armed robberies, or terrorist attacks.

If you've previously watched recordings of losing your most valuable items, from now on you'll only see how an attempted robbery ends before it even begins—while your property remains untouched.

RETAIL STORE

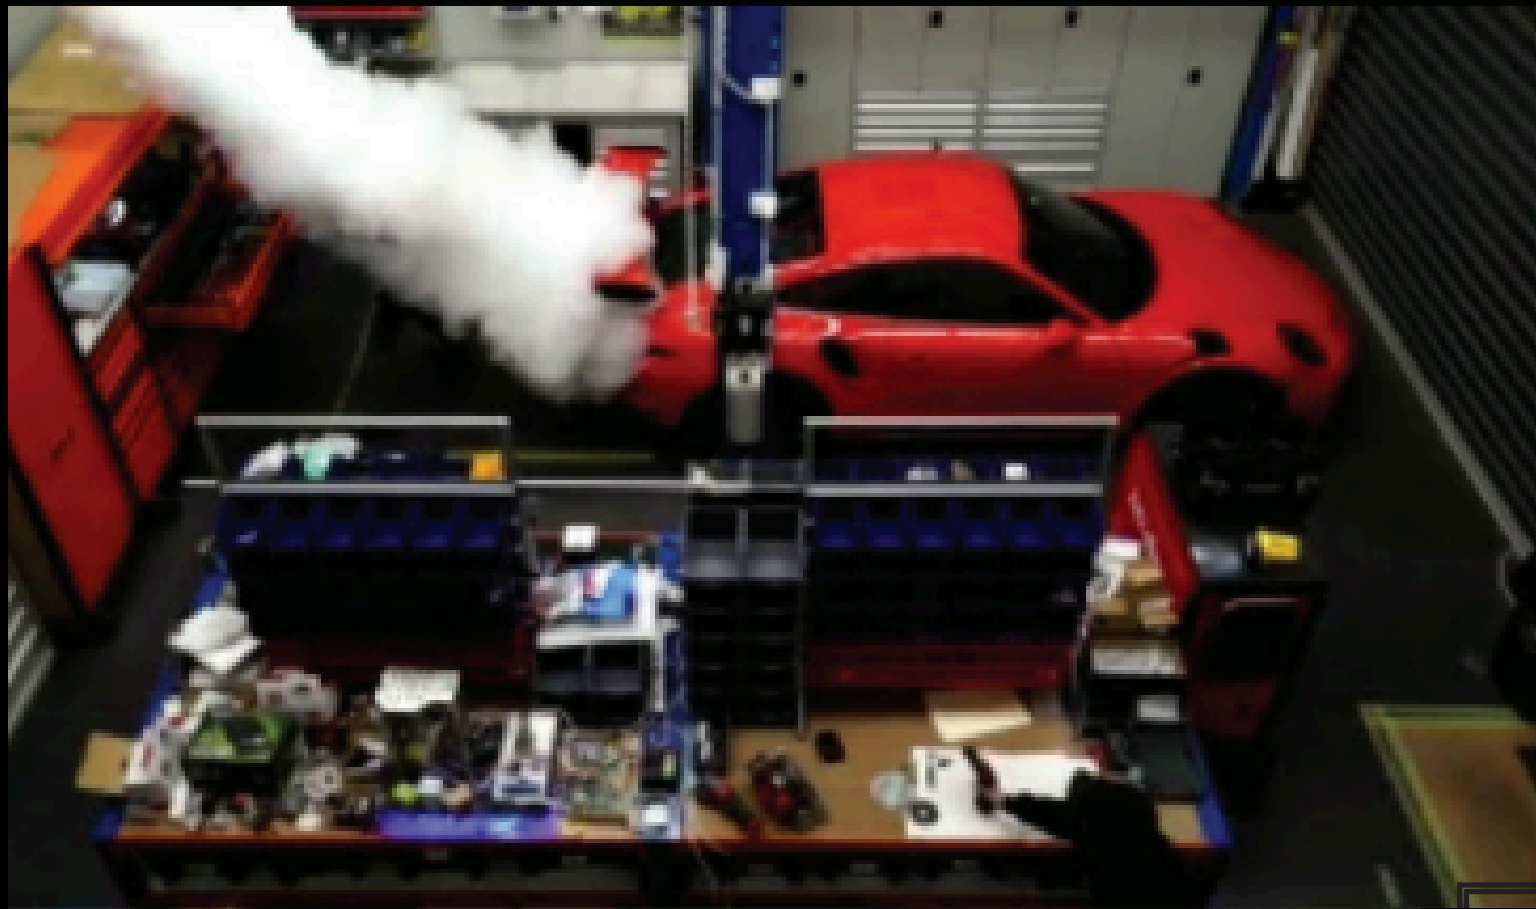

The moment when the employee sees armed intruders on the camera, activates the system using the panic button, and exits through the back door.

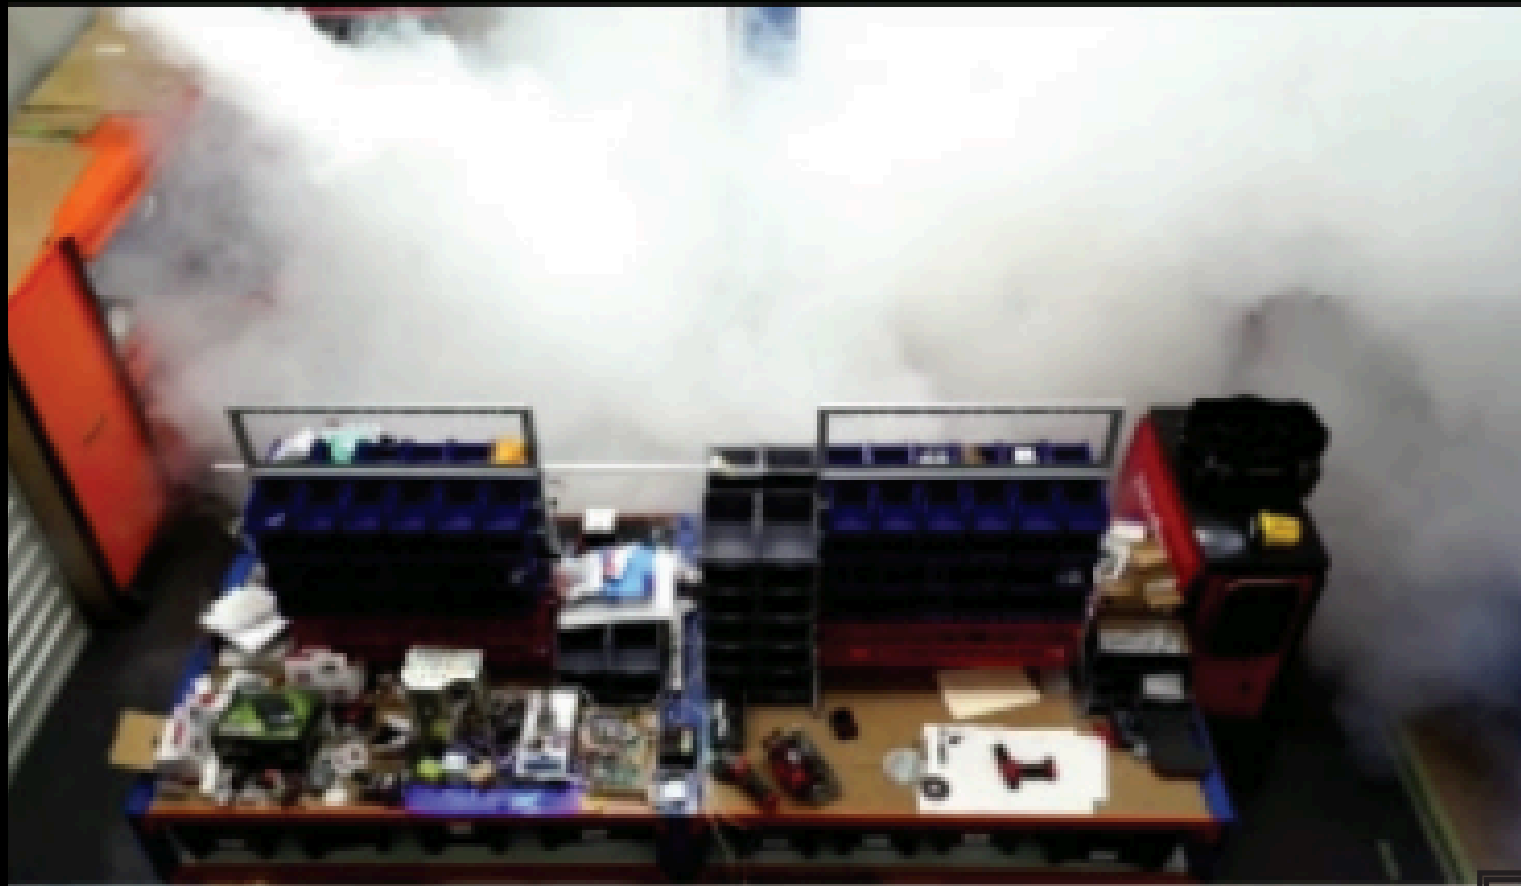

RETAIL STORE

At the moment the system was activated, the intruders rushed out of the premises.

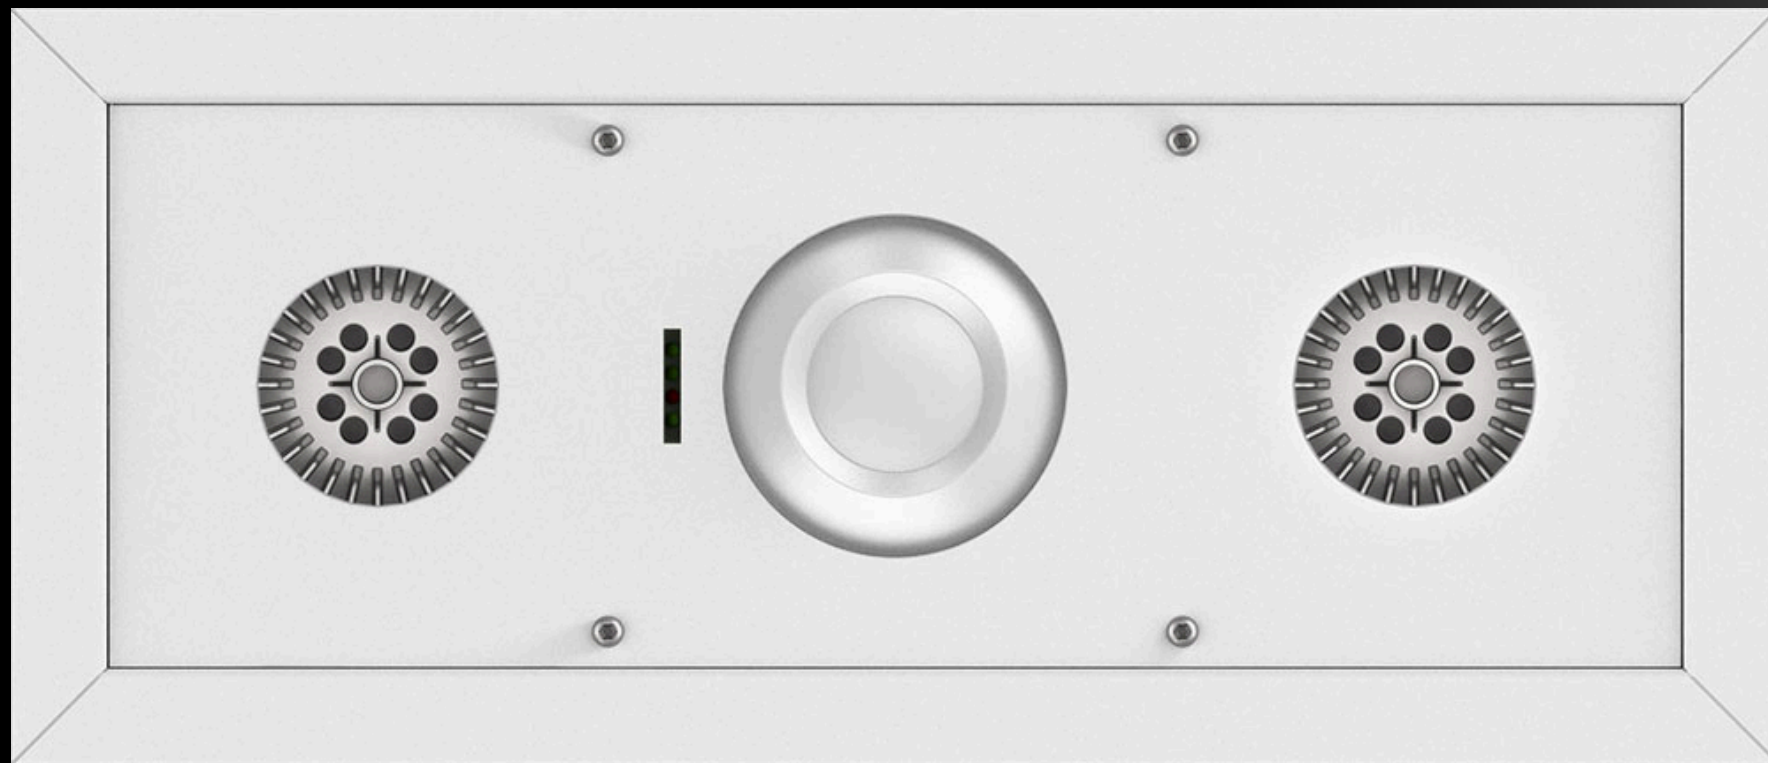

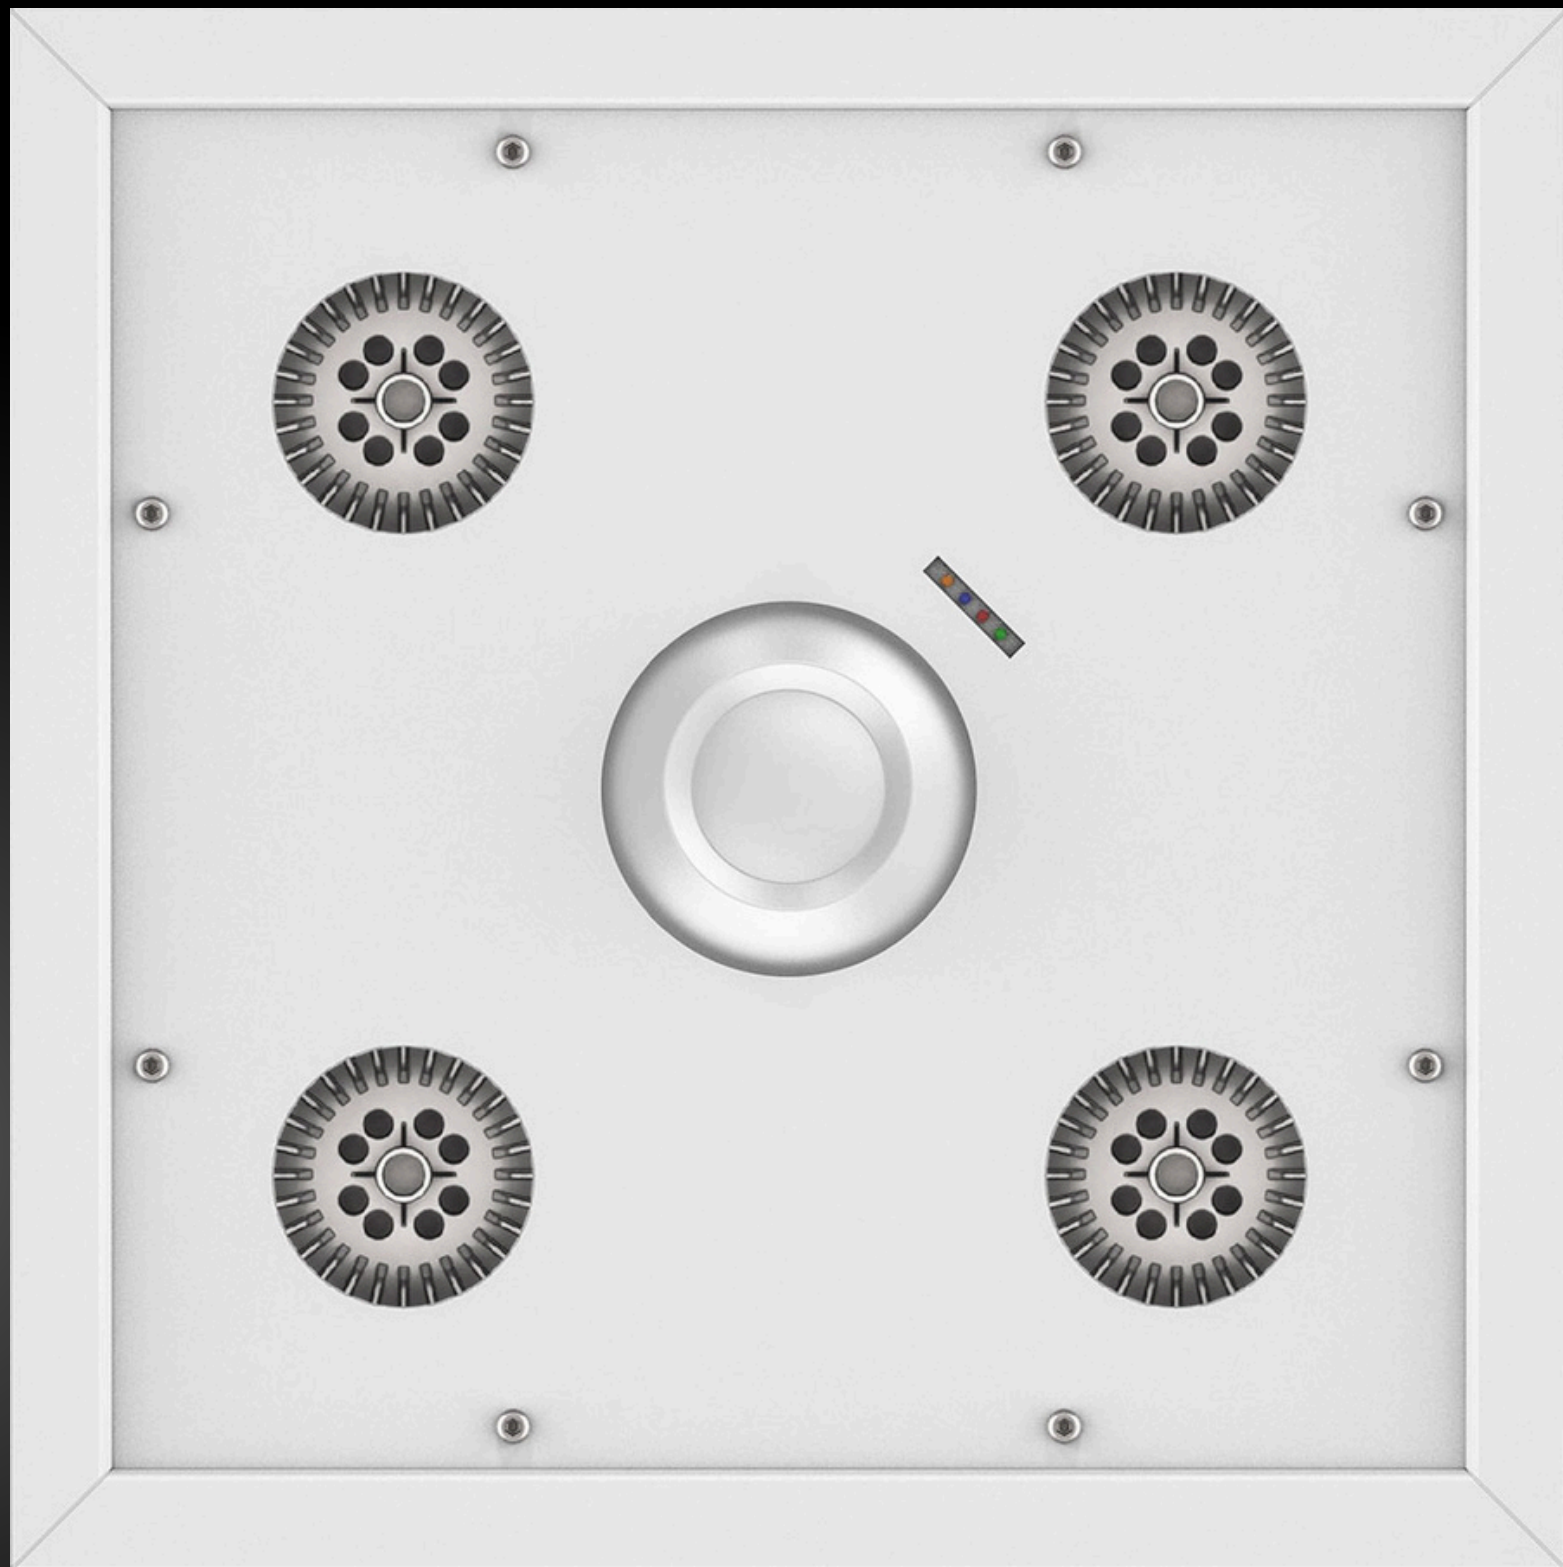

ATTEMPTED THEFT
The robbers attempted to find a spare key for a unique Porsche after receiving a tip on its location. They managed to get through two security doors, but our system surprised them and drove them out.

5 SECONDS LATER

The entire garage was filled with smoke, and they immediately left the premises. They were unable to steal anything.
